

## CONCEPT: PEPTIDE BOND

- Free amino acids can be linked together via \_\_\_\_\_ bonds.
  - *Peptide Bonds*: the \_\_\_\_\_ covalent linkages between amino acids in a polypeptide chain.
  - Total # of peptide bonds is \_\_\_\_\_ less than the total # of amino acids in a chain.
- Peptide bonds form via *endergonic* \_\_\_\_\_ synthesis reactions.
  - Molecule is dehydrated by losing \_\_\_\_\_ during peptide bond formation.
  - *Hydrolysis*: the \_\_\_\_\_ *exergonic* reaction that cleaves a peptide bond.

**EXAMPLE:** Peptide Bond Formation & Breakdown. Circle the  $\alpha$ -carbons ( $C_\alpha$ ).

**PRACTICE:** Considering that peptide bond hydrolysis is exergonic, how is the stability of a peptide bond accounted for?

- Despite the thermodynamic favorability of hydrolysis, peptide bond formation is more favorable.
- The numerous peptide bonds in a typical protein synergistically make hydrolysis unfavorable.
- Peptide bonds are only stable and avoid hydrolysis in cellular environments.
- Though peptide bond hydrolysis is thermodynamically favorable, there is a high energy of activation.

**PRACTICE:** Highlight the peptide bonds in the figure below & circle all the  $\alpha$ -carbons. How many peptide bonds are there?

- 3
- 4
- 5
- 6

**CONCEPT: PEPTIDE BOND**

**PRACTICE:** Which of the following best represents the backbone atom arrangement of two peptide bonds?

- a)  $C_{\alpha} \text{---} N \text{---} C_{\alpha} \text{---} C \text{---} C_{\alpha} \text{---} N \text{---} C_{\alpha} \text{---} C$ .
- b)  $C_{\alpha} \text{---} N \text{---} C \text{---} C \text{---} N \text{---} C_{\alpha}$ .
- c)  $C \text{---} N \text{---} C_{\alpha} \text{---} C_{\alpha} \text{---} C \text{---} N$ .
- d)  $C_{\alpha} \text{---} C \text{---} N \text{---} C_{\alpha} \text{---} C \text{---} N$ .
- e)  $C_{\alpha} \text{---} C_{\alpha} \text{---} C \text{---} N \text{---} C_{\alpha} \text{---} C_{\alpha} \text{---} C$ .

**PRACTICE:** Circle all the peptide bonds in the tripeptide structure below?
