

CONCEPT: INHIBITION CONSTANT

- Recall: every reaction has a _____ constant (k) indicating reaction rate efficiency/probability under set conditions.
 - The *higher* the k , the _____ likely the reaction is _____.
- Reactions that form & breakdown the _____ & ESI complexes also have rate constants:
 - Rate constant for Inhibitor-complex _____/association = k_{EI} or k_{ESI}
 - Rate constant for Inhibitor-complex *breakdown*/_____ = k_{-EI} or k_{-ESI}

Inhibition Constant of Free Enzyme (E)

- _____ -state conditions apply to both the ES & _____ complexes (rate of formation of EI = rate of breakdown of EI).
 - Just like we derive the constant _____ from steady-state conditions, we also derive the *inhibition constant* (K_I).
- Inhibition constant* (K_I): the dissociation constant for _____-enzyme-inhibitor-complex (EI).
 - Similar to how $K_m = [S]$ that allows $V_0 = \frac{1}{2}V_{max}$, $K_I = []$ that allows _____ maximum-inhibition.
 - Similar to how K_m measures enzyme-substrate affinity, K_I measures enzyme-_____ affinity.
 - The _____ the K_I , the _____ the *binding affinity* an enzyme has for that inhibitor.

Review:

$$K_m = \frac{\text{ES dissociation}}{\text{ES association}} = \frac{k_{-1} + k_2}{k_1} = \frac{[\text{E}][\text{S}]}{[\text{ES}]}$$

New:

$$K_I = \frac{\text{EI dissociation}}{\text{EI association}} = \frac{[]}{[]} = \frac{[] []}{[]}$$

EXAMPLE: A) Consider the data in the chart below. Which enzyme has the strongest binding affinity for its *substrate*?

- a) Enzyme A. b) Enzyme B. c) Enzyme C.

B) Which enzyme has the strongest binding affinity for its *inhibitor*?

- a) Enzyme A. b) Enzyme B. c) Enzyme C.

Enzyme	K_m (M)	K_I (M)
Enzyme A	0.031	7.2×10^{-6}
Enzyme B	0.025	8.7×10^{-5}
Enzyme C	0.015	1.4×10^{-3}

CONCEPT: INHIBITION CONSTANT

Inhibition Constant of ES-Complex

● *Inhibition constant (K'_I):* the dissociation constant for enzyme-substrate-inhibitor-complex (_____).

□ K'_I measures _____-complex affinity for _____ to form ESI.

$$K'_I = \frac{\text{ESI dissociation}}{\text{ESI association}} = \frac{k_{-ESI}}{k_{ESI}} = \frac{[E][S]}{[ESI]}$$

PRACTICE: Use the data in the chart below to determine the answer to the following:

A) Rank the enzymes in order of their binding affinity to their *substrate* (strongest affinity → weakest affinity).

- a) $A \rightarrow B \rightarrow C$. b) $C \rightarrow A \rightarrow B$. c) $C \rightarrow B \rightarrow A$. d) $B \rightarrow A \rightarrow C$.

Enzyme	k_{cat} (s^{-1})	K_m (M)	$\frac{k_{cat}}{K_m}$ ($M^{-1}s^{-1}$)	K_I (M)
Enzyme A	0.06	0.031	1.94	7.2×10^{-6}
Enzyme B	2.8	0.025	112	8.7×10^{-5}
Enzyme C	0.14	0.015	9.33	1.4×10^{-3}

B) Rank the enzymes in order of their binding affinity to the *inhibitor* (strongest affinity → weakest affinity).

- a) $A \rightarrow B \rightarrow C$. b) $B \rightarrow C \rightarrow A$. c) $C \rightarrow B \rightarrow A$. d) $B \rightarrow A \rightarrow C$.

C) Which enzyme would you expect the inhibitor to affect the most? Why?

- a) Enzyme A. b) Enzyme B. c) Enzyme C.

PRACTICE: Calculate the Michaelis constant (K_m) and the inhibition constant (K_I) given the following information:

$$[E] = 20 \text{ mM}. \quad [S] = 15 \text{ mM}. \quad [ES] = 5 \text{ mM}. \quad [I] = 8 \text{ mM}. \quad [EI] = 2 \text{ mM}.$$

- a) $K_m = 7 \text{ mM}$; $K_I = 14 \text{ mM}$. d) $K_m = 60 \text{ mM}$; $K_I = 80 \text{ mM}$.
 b) $K_m = 10 \text{ mM}$; $K_I = 20 \text{ mM}$. e) $K_m = 60 \text{ mM}$; $K_I = 20 \text{ mM}$.
 c) $K_m = 20 \text{ mM}$; $K_I = 80 \text{ mM}$.
