

CONCEPT: PROTEIN PURIFICATION

● Protein purification: process of _____ a protein of interest so that it's the only batch of protein molecule in solution.

- _____ techniques are used for protein purification.
- Purification techniques exploit unique differences in protein properties (ex. _____, _____, polarity, etc.).

EXAMPLE: Protein Purification.

PRACTICE: Which of the following is likely the most appropriate meaning of protein purification?

- a) Literally isolating only one single protein molecule.
- b) Isolating a batch of the same exact protein molecule.
- c) Isolating a batch of different protein molecules.
- d) Isolating all the proteins of an organism's proteome.

Protein Purification Strategy

● A typical strategy for protein purification consists of sequential use of the following techniques:

Protein Purification Strategy
1. Protein _____.
2. Differential _____.
3. _____ Out.
4. _____.
5. _____.

PRACTICE: A scientist is looking to study a specific protein called mitochondrial transcription factor A (TFAM). Which of the following is the most appropriate sequence of steps for protein purification of TFAM?

- a) Extraction → Dialysis → Salting Out → Differential Centrifugation → Chromatography.
- b) Extraction → Chromatography → Differential Centrifugation → Salting Out → Dialysis.
- c) Extraction → Differential Centrifugation → Salting Out → Dialysis → Chromatography.
- d) Extraction → Salting Out → Dialysis → Chromatography → Differential Centrifugation.
