

CONCEPT: RATIOS – ACCOUNTS RECEIVABLE TURNOVER

- The **Accounts Receivable Turnover Ratio** relates the amount of _____ to average AR levels.
 - The Accounts Receivable Turnover ratio is a common _____ ratio

$$AR\ Turnover = \frac{Net\ (Credit)\ Sales}{Average\ Net\ AR\ Balance} = \frac{Net\ (Credit)\ Sales}{(Beginning\ AR + Ending\ AR) \div 2}$$

Note: An average balance is used in many ratios. It is always calculated as _____.
If you are only given one balance (i.e. ending balance), just use that number (no average!)

Analysis: The AR Turnover tells us how many sales dollars we get for each dollar of credit we extend.

Comparison: Different industries have different reasonable AR Turnovers, use **benchmarking** _____ turnover ratios imply a more efficient use of AR (extending credit)

Red Flag: An abnormally _____ AR turnover may signal that credit terms are too tight.
The company could lose potential customers.

EXAMPLE: XYZ Company had net sales of \$500,000 and COGS of \$320,000. If the beginning balance of AR was \$75,000 and the ending balance in AR was \$25,000, what is the AR Turnover ratio?

- a) 3.6
- b) 6.66
- c) 10
- d) 20

PRACTICE: ABC Company had \$200,000 in Net Sales and Gross Profit of \$80,000. If AR had a balance of \$16,000, what is the AR Turnover ratio?

- a) 5
- b) 7.5
- c) 12.5
- d) Not enough information
