

### **CONCEPT: POSITRON EMISSION**

**Positron Emission** occurs when an unstable nucleus emits a positron. The positron is the antiparticle of the electron, with the same mass as an electron, but with the opposite sign.

A positron particle can be represented by \_\_\_\_\_ and in the overall reaction a proton is converted into a neutron and emits a positron.

**EXAMPLE:** Write balanced nuclear equations for each of the following positron emissions.

a. Uranium (U) – 235

b. Radon (Rn) – 222

**EXAMPLE:** A nuclide of Th – 225 undergoes 3 alpha decays, 4 beta decays and a gamma emission. What is the product?

- a. Radium
- b. Radon
- c. Actinium
- d. Cadmium
- e. Antimony
