

## CONCEPT: REACTIONS AT BENZYLIC POSITIONS

- Benzylic positions are \_\_\_\_\_ due to stable reaction intermediates.

1)  $S_N1/E1$ : \_\_\_\_\_ formation.

2)  $S_N2/E2$ : benzylic \_\_\_\_\_.

3) Oxidation of benzylic \_\_\_\_\_.

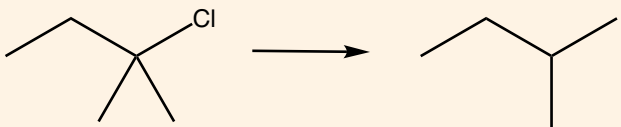

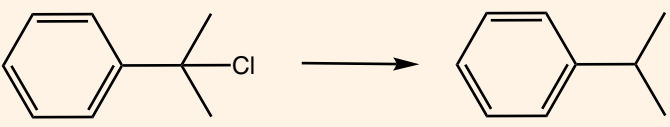

### 1) $S_N1/E1$ Reactions of Benzylic Compounds

- Carbocation intermediate formation is the \_\_\_\_\_-determining step.

☐ Benzylic carbocations form \_\_\_\_\_ than their non-benzylic counterparts.

- **Alkyl  $C^+$** : stabilized by \_\_\_\_\_ conjugation.    - **Benzylic  $C^+$** : stabilized by \_\_\_\_\_.

☐ Ortho & para substituents that act as electron \_\_\_\_\_ groups \_\_\_\_\_  $S_N1$  rates at benzylic positions.

**EXAMPLE:** Which of the following alkyl halides will form a carbocation the fastest?

**CONCEPT: REACTIONS AT BENZYLIC POSITIONS**

**PRACTICE:** Rank the following alkyl halides in increasing order of reactivity in  $S_N1$  reaction.

**PRACTICE:** Which of the following alcohols will undergo acid-catalyzed dehydration the fastest and which one the slowest?

a) 1 and 2

b) 3 and 2

c) 2 and 3

d) 3 and 4

## CONCEPT: REACTIONS AT BENZYLIC POSITIONS

### 2) E2 Reactions of Benzylic Hydrogens

- Due to higher \_\_\_\_\_ of **benzylic  $\beta$ -hydrogens**, \_\_\_\_\_ products predominate.
  - Alkene products of such eliminations are conjugated and are stabilized by \_\_\_\_\_.

**EXAMPLE:** Select a compound that will have the fastest rate of E2 reaction with a small strong base.

d) both a and b

e) both a and c

**PRACTICE:** Provide mechanism and structure of major elimination product of the following reaction.

## CONCEPT: REACTIONS AT BENZYLIC POSITIONS

### 3) Benzylic Alcohol Oxidation

- A weak oxidation where \_\_\_\_\_/CH<sub>2</sub>Cl<sub>2</sub> \_\_\_\_\_ oxidizes the benzylic –OH group.
  - Benzylic alcohols are much more \_\_\_\_\_ than non-benzylic alcohols.

**EXAMPLE:** Give structure of product of following oxidation reaction.

**PRACTICE:** Supply the reagents necessary to accomplish the following transformation.
