

CONCEPT: ELECTRIC POTENTIAL ENERGY

- If you release 2 charges, they move → gain _____
 - Two charges have a “stored” energy → _____
 - ENERGY CONSERVATION: $-\Delta U = \Delta K$

- Electric potential energy between TWO POINT CHARGES:

$$\rightarrow U = \underline{\hspace{2cm}}$$

- Be careful! Decreases $1/r$, **not** $1/r^2$
- The signs of the charges & energy **DO** matter

EXAMPLE: How far apart must a $3 \mu\text{C}$ and a $-2 \mu\text{C}$ charge be so that their potential energy is -100 mJ ?

- Potential energy for a GROUP OF CHARGES:

- $U_{\text{TOT}} = \underline{\hspace{2cm}}$

- This is the energy needed to separate each charge _____.

EXAMPLE: How much potential energy is carried by the following system of charges?
