

CONCEPT: Energy of Circular Orbits

- You'll see problems where an object changes from one orbit to another
- To solve changing orbit problems, use Energy Conservation:

$$K_i + U_i + W_{NC} = K_f + U_f$$

- To change orbits, there must be some _____ done.

Changing orbital distance

EXAMPLE 1: How much work is needed for a 200-kg spacecraft to travel from a circular orbit 300km above Earth to a higher circular orbit 35,900 km high?

Changing orbital velocity

EXAMPLE 2: How much work is needed for a 200-kg spacecraft travelling around Earth to change from a circular orbit in which it travels at 6000m/s to a different circular orbit in which it travels at 9000m/s?

$$E_{\text{circ}} = K + U = \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

- The Kinetic and Potential energies in an orbit are CONSTANT.
- To increase/enlarge an orbit, the work done must be [**POSITIVE** | **NEGATIVE**]
 - r ____, v ____
- To decrease/shrink an orbit, the work done must be [**POSITIVE** | **NEGATIVE**]
 - r ____, v ____

ORBIT
$v_{\text{sat}} = \sqrt{\frac{GM}{r}}$
$K = \frac{1}{2}mv^2$
$U = -\frac{GMm}{r}$

PRACTICE: The 12,000-kg Lunar Command Module is in a circular orbit above the Moon's surface. If it spends $\frac{1}{4}$ of its fuel energy (-1.74×10^9 J) bringing it to a circular orbit just above the surface, how high was its original orbit?

EQUATIONS	CONSTANTS
$v_{\text{sat}} = \sqrt{\frac{GM}{r}} \quad v_{\text{sat}} = \frac{2\pi r}{T}$ $T_{\text{sat}}^2 = \frac{4\pi^2 r^3}{GM}$	$G = 6.67 \times 10^{-11} \frac{\text{m}^3}{\text{kg} \cdot \text{s}^2}$ $M_E = 5.97 \times 10^{24} \text{ kg}$ $R_E = 6.37 \times 10^6 \text{ m}$
$U_G = -\frac{GMm}{r}$ $K_i + U_i + W_{\text{NC}} = K_f + U_f$	$M_{\text{Moon}} = 7.35 \times 10^{22} \text{ kg}$ $R_{\text{Moon}} = 1.74 \times 10^6 \text{ m}$
$E_{\text{circ}} = -\frac{GMm}{2r} = -\frac{1}{2}mv^2$	

PRACTICE: a) How much work do you have to do on a 100-kg payload to move it from Earth's surface to a height of 1000km? b) How much additional work must you do to put this payload into orbit at this altitude?

EQUATIONS	CONSTANTS
$v_{\text{sat}} = \sqrt{\frac{GM}{r}} \quad v_{\text{sat}} = \frac{2\pi r}{T}$ $T_{\text{sat}}^2 = \frac{4\pi^2 r^3}{GM}$	$G = 6.67 \times 10^{-11} \frac{\text{m}^3}{\text{kg} \cdot \text{s}^2}$ $M_E = 5.97 \times 10^{24} \text{ kg}$ $R_E = 6.37 \times 10^6 \text{ m}$ $M_{\text{Moon}} = 7.35 \times 10^{22} \text{ kg}$ $R_{\text{Moon}} = 1.74 \times 10^6 \text{ m}$
$U_G = -\frac{GMm}{r}$	
$K_i + U_i + W_{\text{NC}} = K_f + U_f$	
$E_{\text{circ}} = -\frac{GMm}{2r}$
