

SPRING FORCE

- When you push/pull against a spring with F_A , the spring pushes back (Newton's ____ Law):

$$F_s = -F_A = \underline{\hspace{2cm}}$$

- $x = \underline{\hspace{2cm}}$ (____ or ____).
- NOT the spring's length, but its **change** $\rightarrow x = \underline{\hspace{2cm}}$.
- k is the spring's ____ (Units: ____)
- How ____ the spring is. Higher $k \rightarrow$ ____ to deform.
- F_s is a ____ force, always opposite to deformation (____)
- Always pulling spring back to its original length ($x = \underline{\hspace{1cm}}$).

EXAMPLE 1: A 1.0 m-long spring is laid horizontally with one of its ends fixed. When you pull on it with 50 N, it stretches to 1.2 m. **(a)** What is the spring's force constant? **(b)** How much force is needed to compress it to 0.7 m?

- If you attach a mass to a vertical spring, and let the mass come down slowly:

- Its weight will stretch the spring, until they reach ____:

$$\underline{\hspace{2cm}} = \underline{\hspace{2cm}}$$

- This also applies to a mass on top of a spring, slowly compressing it.

PRACTICE 1: A vertical spring is originally 60 cm long. When you attach a 5 kg object to it, the spring stretches to 70 cm. **(a)** Find the force constant on the spring. **(b)** You now attach an additional 10 kg to the spring. Find its new length.
