

## CONCEPT: IDEAL GASES AND THE IDEAL GAS LAW

- **Ideal Gas** = A simplified, “perfect” gas that satisfies the following conditions:

- 1) The gas has a low \_\_\_\_\_, i.e. particles very spread out (low pressure, high temperature)
- 2) There are no \_\_\_\_\_ between the gas particles
- 3) Particles have zero \_\_\_\_\_, so we can treat them as points
- 4) Particles move in straight lines and collide \_\_\_\_\_ (energy is conserved)

- Under everyday conditions, most real gases already behave very much like ideal gases.

- The **IDEAL GAS LAW** relates Pressure (**P**), Volume (**V**), Temperature (**T**), and moles (**n**) for any ideal gas:

<u>Use when given <math>n</math></u> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 0 auto;">_____ = _____</div>	OR	<u>Use when given <math>N</math></u> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 0 auto;">_____ = _____</div>		
$n = \# \text{ moles}$	$\longleftrightarrow$	<div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 0 auto;"> <math>n = \frac{N}{N_A} = \frac{N}{6.02 \times 10^{23}}</math> </div>	$\longrightarrow$	$N = \# \text{ of particles}$
$R = 8.314 \left[ \frac{J}{mol \cdot K} \right]$ (universal gas constant)  $T$ must be in K				$k_B = 1.38 \times 10^{-23} \left[ \frac{J}{K} \right]$ (Boltzmann constant)

- “**STP**” (**S**tandard **T**emperature & **P**ressure) is a common set of conditions defined as  $T=0^\circ\text{C}=273\text{K}$ ,  $P=1\text{atm}=1.01 \times 10^5\text{Pa}$

EXAMPLE: What is the volume that exactly 1 mole of an ideal gas occupies at **STP**?

Volume Conversions
$1 \text{ cm}^3 = 1 \text{ mL}$ $1 \text{ m}^3 = 1000 \text{ L}$

- 1 mole of ANY ideal gas at STP has a volume of exactly \_\_\_\_\_. This is sometimes called “Molar Volume at STP”

**PROBLEM:** 3 moles of an ideal gas fill a cubical box with a side length of 30cm. If the temperature of the gas is 20°C, what is the pressure inside the container?

- A)  $2.7 \times 10^5$  Pa
- B) 0.27 Pa
- C)  $1.85 \times 10^4$  Pa
- D)  $8.12 \times 10^3$  Pa

IDEAL GAS EQs & Constants
$PV = nRT = Nk_B T$
$R = 8.314 \frac{J}{mol \cdot K}$ $k_B = 1.38 \times 10^{-23} \frac{J}{K}$ $N_A = 6.02 \times 10^{23} \frac{particles}{mol}$

**PROBLEM:** Hydrogen gas behaves very much like an ideal gas. If you have a sample of Hydrogen gas with a volume of 1000 cm<sup>3</sup> at 30°C with a pressure of  $1 \times 10^5$  Pa, calculate how many hydrogen atoms (particles) there are in the sample.

- A)  $2.42 \times 10^{22}$
- B)  $2.39 \times 10^{22}$
- C)  $2.39 \times 10^{28}$

IDEAL GAS EQs & Constants
$PV = nRT = Nk_B T$
$R = 8.314 \frac{J}{mol \cdot K}$ $k_B = 1.38 \times 10^{-23} \frac{J}{K}$ $N_A = 6.02 \times 10^{23} \frac{particles}{mol}$

## CONCEPT: SOLVING IDEAL GAS PROBLEMS WITH CHANGING STATES

- In some ideal gas problems, you'll have to compare an initial & final "state" of a gas.

- In *most* of these problems, \_\_\_ of the 4 variables remain constant.

$$\underline{\hspace{2cm}} = \underline{\hspace{2cm}} \Rightarrow \boxed{\underline{\hspace{2cm}} = \underline{\hspace{2cm}}}$$

**EXAMPLE:** You fill an insulated container with 2 moles of an ideal gas such that no gas can leak out. The container is then compressed with a piston at constant temperature. The initial pressure is  $1 \times 10^5$  Pa. If the initial volume is  $0.05 \text{ m}^3$  and the gas is compressed to  $0.01 \text{ m}^3$ , calculate the final pressure.

### IDEAL GAS LAW

- Write  $\frac{P_i V_i}{n_i T_i} = \frac{P_f V_f}{n_f T_f}$
- Cancel out "constant" variables
- Solve for Target

- There are 3 "special cases" of the ideal gas law (historically called **The Gas Laws**) where  $n$  & *another variable* are fixed.

- **Boyle's Law:** If  $T$  constant,  $P$  is inversely proportional to  $V$ .  $\frac{P_i V_i}{n_i T_i} = \frac{P_f V_f}{n_f T_f} \Rightarrow \boxed{P_i V_i = \text{constant} = P_f V_f}$

- **Charles's Law:** If  $P$  constant,  $V$  is directly proportional to  $T$ .  $\frac{P_i V_i}{n_i T_i} = \frac{P_f V_f}{n_f T_f} \Rightarrow \boxed{\frac{V_i}{T_i} = \text{constant} = \frac{V_f}{T_f}}$

- **Gay-Lussac's Law:** If  $V$  constant,  $P$  is directly proportional to  $T$ .  $\frac{P_i V_i}{n_i T_i} = \frac{P_f V_f}{n_f T_f} \Rightarrow \boxed{\frac{P_i}{T_i} = \text{constant} = \frac{P_f}{T_f}}$

**PROBLEM:** A balloon contains 3900cm<sup>3</sup> of a gas at a pressure of 101 kPa and temperature of -9°C. If the balloon is warmed such that the temperature rises to 28°C, what volume will the gas occupy? Assume the pressure remains constant.

- A) 0.012 m<sup>3</sup>
- B) 0.0041 m<sup>3</sup>
- C) 0.39 m<sup>3</sup>
- D) 0.0044 m<sup>3</sup>

#### IDEAL GAS LAW PROBLEMS

- 1) Write  $\frac{P_i V_i}{n_i T_i} = \frac{P_f V_f}{n_f T_f}$
- 2) Cancel out "constant" variables
- 3) Solve for Target

#### IDEAL GAS EQs & Constants

$$PV = nRT = Nk_B T$$

$$R = 8.314 \frac{J}{mol \cdot K} = 0.08206 \frac{L \cdot atm}{mol \cdot K}$$

$$k_B = 1.38 \times 10^{-23} \frac{J}{K}$$

$$N_A = 6.02 \times 10^{23} \frac{particles}{mol}$$

**PROBLEM:** An ideal gas in a sealed container with a volume of 2.8 L, pressure of 0.15 atm and a temperature of 40°C is warmed until the pressure and volume both double. **a)** What is the final temperature? **b)** How many moles of gas are there?

#### IDEAL GAS LAW PROBLEMS

- 1) Write  $\frac{P_i V_i}{n_i T_i} = \frac{P_f V_f}{n_f T_f}$
- 2) Cancel out "constant" variables
- 3) Solve for Target

#### IDEAL GAS EQs & Constants

$$PV = nRT = Nk_B T$$

$$R = 8.314 \frac{J}{mol \cdot K} = 0.08206 \frac{L \cdot atm}{mol \cdot K}$$

$$k_B = 1.38 \times 10^{-23} \frac{J}{K}$$

$$N_A = 6.02 \times 10^{23} \frac{particles}{mol}$$

- You may be given volume units of **L** and pressure units of **atm**. Useful conversions to know:

$$1 \text{ L} = 0.001 \text{ m}^3$$

$$1 \text{ atm} = 1.01 \times 10^5 \text{ Pa}$$
